Beta Testing: What to Report

1. Quick Start

Install **ScriptHookV** and **ScriptHookVDotNet**.

Copy the complete scripts folder from the package into the GTA V main directory.

Make sure the Windows account used to run GTA V has **read/write/modify** permission for GTA V/scripts/InternetRadio/.

Start GTA V in **Singleplayer**.

Enter a supported vehicle.

Press NUM0 to open the multimedia menu.

Navigate with NUM8 / NUM2 and select with NUM5.

On first use, scripts/InternetRadio/UserSettings.ini is created automatically. Personal settings are stored there separately from the main configuration.

Reference setup for this beta

ScriptHookV .NET Enhanced 3.9.0.6 (1.1.0.6)

API 3.9.0

GTA V Enhanced / Singleplayer

Other compatible SHVDN versions may work. If you get compile errors, first make sure ScriptHookVDotNet.asi, ScriptHookVDotNet2.dll and ScriptHookVDotNet3.dll all come from the **same release package**.

2. Controls

Key

Action

NUM0

Open / close multimedia menu

NUM8 / NUM2

Move selection; previous/next track in Spotify/YouTube

NUM4 / NUM6

Change tab; previous/next station/source action outside menu

NUM5

Select / apply / activate source

NUM1

Active source on/off or play/pause

NUM3

Stop/pause active source

NUM- / NUM+

Volume down / up

NUM7

Hazard lights on / off

NUM9

Manual high beams on / off

SPACE

Add/remove station favorite

DELETE

Remove selected favorite

F8

Reload configuration

ESC / BACK

Close menu

Num Lock should be enabled.

3. HOME and Audio Sources

HOME is the main hub for Internet Radio, GTA Radio, YouTube Music, Spotify, CAR / Vehicle, Skins / Themes, Settings and Info.

The last active source is restored where possible after vehicle changes and restarts. Internet Radio, GTA Radio, Spotify and YouTube Music are tracked separately.

4. Internet Radio

Choose stations by category. Track and artist metadata is shown when the stream provides it.

Streams are operated by third parties. A station can go offline, change its URL or be region-blocked independently of the mod. If one station does not work, test another station first.

5. Spotify and YouTube Music

Spotify and YouTube Music use the available Windows/app media session.

Open Spotify or YouTube Music.

Start a track.

Open the matching tab in the LS multimedia menu.

Press NUM5 to activate the source.

NUM1 = Play/Pause, NUM8 / NUM2 = previous/next track.

The right-side status panel shows connection state and app volume. **NOT CONNECTED** means that no matching media session is currently detected.

6. Favorites

Press SPACE on a station to add or remove it as a favorite. Up to **6 favorites** are supported. Press DELETE to remove the selected favorite.

Favorites are stored in the user settings and remain available after a restart.

7. CAR / Vehicle Menu

The **CAR / VEHICLE** tab contains optional comfort, lighting and display features. Depending on the vehicle, these include automatic indicators, hazards via NUM7, high beams via NUM9, Beat Neon, cabin light, plate light, Turbo Blow-Off, speedometer / Mini HUD, manufacturer logo, RPM and vehicle displays.

Not every feature is useful for every vehicle class. Bicycles, trains and other special vehicles may intentionally skip some systems.

8. Lights and Plate Light

v1.0.2 Beta Test uses the tested v7.41 plate-light logic:

The plate light stays **OFF during normal daylight**.

Daylight, shadows, DRL or automatic GTA light reports do not switch it on by themselves.

Explicit driver light intent can enable it during daytime.

At night it follows the real low/high beams.

Brief light-state changes are debounced to prevent flicker.

PLATE LIGHT must be enabled in the CAR menu.

Static neon can provide the plate-light color. Without static neon, the plate lamp follows the normal/xenon light family. Beat Neon does not pulse the plate lamp.

9. Turbo Blow-Off

Turbo Blow-Off is intentionally ON / OFF only. When enabled, one stronger SPORT-style blow-off accent is triggered after real turbo load on an upshift or a clear throttle lift after boost.

Anti-spam logic prevents repeated effect stacks. Detection continues to work at high speed and while airborne. Additional add-on models can be listed in InternetRadio.ini using FactoryTurboModels=.

10. HUD, Speedometer and Vehicle Displays

Road vehicles use speedometer/RPM/vehicle data, boats use a marine HUD, and aircraft/helicopters use a flight HUD.

Speed uses GTA's actual vehicle speed. Manufacturer logos are loaded from GTA vehicle-HUD textures; a neutral fallback is used if no matching logo is available.

11. Settings and Saving

Personal settings are stored automatically in GTA V/scripts/InternetRadio/UserSettings.ini. This includes many UI, audio, vehicle, favorite, last-source and last-station settings.

InternetRadio.ini contains the main configuration, station list, technical defaults and optional add-on configuration. Back up manual changes to this file before updating.

Temporary runtime states such as currently active hazards, high beams or menu cursor position do not need to be saved permanently.

12. Installation, Update and Uninstall

Fresh install

Copy the complete scripts folder from the beta package into the GTA V main directory.

Update

Close GTA V.

Optionally back up scripts/InternetRadio/UserSettings.ini.

Copy the new scripts files over the old ones.

Keep UserSettings.ini if you want to preserve personal settings.

Start GTA V and test the mod.

Uninstall

Remove scripts/03_InternetRadioSimple.3.cs and scripts/InternetRadio/. Do not delete other mods from the scripts folder.

13. Troubleshooting

Menu does not open: Check ScriptHookV, ScriptHookVDotNet, Singleplayer mode and that you are in a supported vehicle.

C# compile error at startup: Open ScriptHookVDotNet.log. Check the installed SHVDN version and make sure all SHVDN files come from the same package. Tested reference: **ScriptHookV .NET Enhanced 3.9.0.6 (1.1.0.6), API 3.9.0.**

Radio does not play: Test another station. Third-party streams can be offline or region-blocked.

Spotify / YouTube shows NOT CONNECTED: Start playback in the app/browser first and check whether Windows exposes a media session.

Settings are not saved: Check read/write/modify permissions for GTA V/scripts/InternetRadio/.

Plate light stays off: Enable PLATE LIGHT in CAR settings and switch on the actual vehicle lights.

Plate light is on during the day or flickers: Report the vehicle name, time of day, light position and, if possible, a short video. v1.0.2 includes the stricter v7.41 logic for this issue.

INI changes have no effect: Press F8 or restart GTA V.

14. Beta Testing: What to Report

Useful information for bug reports: GTA V **Enhanced or Legacy**, ScriptHookVDotNet version, vehicle/add-on spawn name, active source, active setting, exact reproduction steps, screenshot or short video for UI/lighting issues, and relevant lines from ScriptHookVDotNet.log.

Especially important for v1.0.2: right-side UI positioning, plate light behavior, Turbo Blow-Off, user-setting persistence and Spotify/YouTube connection status.

LOS SANTOS INTERNET RADIO LS v1.0.2 BETA TEST

Unofficial GTA V Singleplayer modification.
